Name: Marcus G. Mangubat **Agri-Enumerator SirangLupa**

Narrative Report (June 22, 2026 – June 26, 2026)

JUNE 22, 2026
Today, we submitted our narrative report to the Agriculture Office, together with the pictures documenting our field activities and the farmers we had already visited. After completing the submission, we continued our fieldwork by visiting more farmers listed in the master list. During our visits, we gathered additional information about their farms, current crops, and farming conditions. We also updated our records to ensure that all collected data was complete and accurate.

JUNE 23, 2026
Today, we continued conducting field visits to farmers in Barangay Sirang Lupa. During one of our interviews, we met a farmer who shared that he had temporarily stopped farming because he had been hospitalized due to health-related reasons. We listened to his experience and recorded the necessary information regarding his current farming situation. Afterward, we proceeded to visit other farmers in the area to continue our data collection.

JUNE 24, 2026
Today, we continued our field survey in our assigned barangay. We visited Purok 8 in Tibagan to interview more farmers about the land they cultivate, the crops they currently grow, and the overall condition of their farms. We carefully recorded the information they provided and clarified details whenever necessary. Since we were unable to finish covering the entire Tibagan area within the day, we decided to return the following day to complete our remaining interviews.

JUNE 25, 2026
Today, we returned to Tibagan to continue interviewing the farmers we were not able to visit the previous day. We completed the remaining interviews and gathered additional information about their farming activities, crop production, and land conditions. We also verified the data we had previously collected to ensure its accuracy and completeness. By the end of the day, we had covered most of the farmers assigned to us in the area.

JUNE 26, 2026
Today, we continued visiting farmers to assess the current condition of their farmland and crops. We interviewed the remaining farmers located near our assigned area and completed the necessary data collection. We also reviewed and organized the information we had gathered to ensure that all records were complete and properly documented. By the end of the day, we had made significant progress in completing our assigned fieldwork and preparing the collected data for submission.
